Progress Through Innovation

LASERTEC Series
LASERTEC unlocks new economic opportunities for laser precision machining of technical surface structures, intricate cavities, fine engravings, inscriptions and holes with a wide variety of high-tech materials and diamond tools. As an absolute global first, with its intelligent combination of laser deposition welding and 5-axis milling, LASERTEC presents a way to produce entire 3D components in finished parts quality through additive manufacturing.

The LASERTEC product line focuses on five technological fields: Additive Manufacturing, Shape, PrecisionTool, FineCutting and PowerDrill. Depending on the application and component requirements, a range of laser sources such as YAG, fibre and picosecond lasers can be used. User-specific software packages make it easier to work and program in the various fields of application.

**Flexible LASERTEC technology integration in 5-axis milling machines from DMG MORI.**

By using a special device, a laser scanning head can be substituted into the milling machine. It can be adapted to the milling spindle within minutes via the HSK-interface. This flexible integration of LASERTEC technology allows for 5-axis milling and laser texturing of injection moulds (LASERTEC Shape) or laser deposition welding (LASERTEC Additive Manufacturing*) in one clamping operation on one machine. This distinguishing feature can easily be integrated into the DMU (C) 65 and 125 monoBLOCK®, as well as the DMU 210 from the portal range of DMG MORI.

LASERTEC Additive Manufacturing

Combination of laser deposition welding and 5-axis milling for the additive manufacturing of entire 3D components in milling quality. Can also be used to repair and coat components from, for example, the mould construction and aerospace sectors.

Technology Highlights: Pages 08–13

LASERTEC Shape

Laser structuring of geometrically defined surfaces in plastic injection tools for mould making. 3D laser ablation for filigree cavities, engravings and inscriptions.

Technology Highlights: Pages 14–29

LASERTEC PrecisionTool

Cutting edges, clearance angles and chip breakers in PCD, CVD-D precision tools. Cut out of inserts made of PCD and CBN. Carbide extrusion dies for indexable inserts as well as prototypes.

Technology Highlights: Pages 30–39

LASERTEC FineCutting

Highly dynamic 2D / 3D laser precision cutting of sheets, tubes and 3D parts. Production of components for the watch / medical industry and stamping part components.

Technology Highlights: Pages 40–41

LASERTEC PowerDrill

High-precision 5-axis laser drilling of cooling holes in turbine components for aircraft engines and industrial gas turbines.

Technology Highlights: Pages 42–49
From a filigree embossing tool for the watch industry to a dashboard for cars, from small helicopter turbine blades to the combustor for large industrial gas turbines – LASERTEC has the right machine platform for every application.

Depending on the integrated laser source and programming software, the basic machines are utilised for the different laser technologies. In the LASERTEC 65 / 125 / 210 models the surface structuring and additive manufacturing laser technology is integrated into a fully fledged milling centre via the HSK interface, allowing for full machining (milling and laser texturing/cladding) on one machine.

**Highest Stability / Long-term Stability**
All LASERTEC Series machines are based on a highly stable cast frame construction. The combination of precision construction and a direct positioning measuring system ensure long-term stability and accuracy.

**5-axis Machine Version**
All machines are available as a 5-axis version for laser machining of complex component geometries on one machine. Depending on the series, various 5-axis kinematics are employed.

**Precision**
The latest generation of scanners combined with tailored precision optics for maximum precision and shortened machining times.
Powerful Control

Uniform control philosophy with Siemens 840D solutionline Operate 4.5 3D continuous path control. From 2015 the LASERTEC 20 / 65 / 125 / 210 are also available with CELOS including 21,5” ERGOline® Control with multi-touch screen.

LASERSOFT Software Packages

Application-specific software packages facilitate the programming and operation of the machine. Customised programming systems allow easy creation of machine programmes based on CAD data. Complex processes can be depicted graphically in advance using simulation tools.

Flexible Technology Integration

Integration of a laser scanning head via the HSK 63/100 interface: A unique global selling point thanks to the intelligent combination 5-axis milling and laser texturing and cladding technology on one machine.
Application-specific laser sources available.

Laser deposition welding and milling
Additive manufacturing unlocks new opportunities for high complexity and individuality in the production of prototypes and functional components made of high-performance metallic materials. The additive manufacturing market is growing steadily. For the first time, SAUER LASERTEC has integrated additive manufacturing with lasers into a fully fledged 5-axis milling machine. To date, this innovative hybrid solution is unique on the global market. The process uses an application process featuring a metal powder feed which is up to 10 times faster than generation in a powder bed.

In the past, additive manufacturing was limited to the production of prototypes and small parts. The combination of additive manufacturing with a powder feed and material removal processes on a machine allows for entirely new applications and geometries. Especially large components, which still have an extremely high material removal rate, can be produced cost-effectively thanks to this innovation.

Prototypes and small batches of complex lightweight / integral components:
+ Tool / mould construction
+ Aerospace
+ Automotive
+ Medical

Repair of damaged and worn components, e.g. for:
+ Medical
+ Tool / mould construction
+ Aerospace (e.g. blade tip repair)

Partial or complete coatings (Corrosion and wear prevention):
+ Mould Making
+ Off Shore
+ Engineering
+ Medical
LASERTEC Additive Manufacturing

Additive Manufacturing in Milling quality – the complete generation of a 3D-part.

Turbine housing
Material: Stainless steel
Laser Deposition Welding: 230 min
Milling: 76 min
Dimensions: 180 mm × 150 mm

1: Basic set-up of the cylindric ring
2: 90° swivel: Generation of the flange
3: 90° swivel: Milling of the plane surface and the outer contour
4: Drilling of the flange
5: Continuation of the cylinder generation
6: Build-up of the crossover section
7: Laser construction of the conical funnel
8: Generation of the second flange
9: Manufacturing of the 12 connectors
10: Milling of the connectors
11: Milling of the flange and the inner contour
12: Milling of the inner circular pockets
Machining
+ Entire components can be designed with the SIEMENS NX CAD module
+ **Programming the milling process with NX CAM**
+ Integration of a SAUER module into the NX software for additive manufacturing
+ **The integrated optical process monitor** monitors the application process and regulates the laser output online
+ The workpiece can be **build-up in several steps**. Intermediate milling operations are always possible.
+ It is even possible to produce **full, large components**
+ **3D-geometries** with undercuts realizable

Laser head switching
+ The laser head is moved laterally into the working area by an **automatic shuttle handling system**
+ The spindle travels to the predefined **change position**
+ The laser head is automatically held in place and integrated by the **HSK-A63 interface** on the spindle
+ After the laser head has been adjusted, the shuttle returns to the change position in the working area
+ During milling operations, the laser head is located outside of the working area in order to protect it against coolant and chips

Materials
+ **Stainless steel**
+ **Tool steel**
+ **Aluminium alloys**
+ **Cobalt-chrome-molybdenum alloys**
+ **Bronze alloys**
+ **Noble metal alloys**
+ **Nickel-based alloys**
+ **Tungsten carbide**
+ **Stellite**

Working principle – Laser-Deposition-Welding

The metal powder is welded to the basic material in layers (non-porous and crack-free melting). Thereby the metal powder is joining up with the surface in a high strength connection. A coaxial shielding-gas protects against oxidation during the build-up process. After cooling the metal layers can be machined mechanically.
For the first time, DMG MORI has integrated additive manufacturing with lasers into a fully fledged 5-axis milling machine. This intelligent hybrid solution combines the flexibility of additive manufacturing with the precision of material removal, thus allowing for the additive manufacturing of full components in milling quality.

The procedure involves an application process featuring a metal powder feed which allows for full machining without a processing chamber and which is up to 10 times faster than generation in a powder bed. Additionally, steep contours can be produced with absolutely no supporting structure. The combination of additive manufacturing with material removal on one machine allows for entirely new applications and geometries. In particular, large components can be produced cost-effectively with this hybrid solution. The flexible switching between laser and milling operations allows for the direct machining of segments that can no longer be reached on the finished part.

LASERTEC 65 3D
Additive Manufacturing in Milling quality.

For the first time, DMG MORI has integrated additive manufacturing with lasers into a fully fledged 5-axis milling machine. This intelligent hybrid solution combines the flexibility of additive manufacturing with the precision of material removal, thus allowing for the additive manufacturing of full components in milling quality.

The procedure involves an application process featuring a metal powder feed which allows for full machining without a processing chamber and which is up to 10 times faster than generation in a powder bed. Additionally, steep contours can be produced with absolutely no supporting structure. The combination of additive manufacturing with material removal on one machine allows for entirely new applications and geometries. In particular, large components can be produced cost-effectively with this hybrid solution. The flexible switching between laser and milling operations allows for the direct machining of segments that can no longer be reached on the finished part.

Highlights
+ The intelligent combination of laser cladding and milling allows for the best surface finishes and component precision
+ Laser deposition welding with powder feed: 10 times faster than the powder bed; steep contours with no supporting geometry
+ It is even possible to produce full components
+ Realisation of 3D geometries with undercuts
+ Direct machining of areas that can no longer be reached on the finished part
For the first time, DMG MORI has integrated additive manufacturing with lasers into a fully fledged 5-axis milling machine. Machine and Technology
- 3D Ablation / Texturing
Control Technology
Technical Data

3D Laser Ablation
1: Fine contours and filigree cavities

5-axis Laser Texturing
2: Design advantage for injection mould making
LASERTEC Shape

LASERTEC Shape: Filigree surface texturing, 3D ablation, laser engraving.

With the LASERTEC Shape Series, fine contours and filigree cavities for injection moulds, extrusion dies, inscriptions and other engravings can be consistently and reliably produced with the highest quality and minimal tool wear. Depending on the application, there are machine configurations with three laser sources featuring different ablation characteristics available: diode, fibre, and picosecond lasers. Depending on the material and laser source, walls up to max. 2 mm deep and surface quality of Ra < 0.3 μm is possible.

The machine programme itself can be generated automatically from the 3D CAD data of the actual work piece. The optionally available LASERSOFT software packages simplify e.g. contour generation, lettering, logos and surface structuring in 3D surfaces, cylinders or free-form surfaces.
3D Laser Ablation

3D laser ablation for the production of miniature moulds, extrusion dies, inscriptions and engravings.

**Highlights / 3D Laser Ablation**

- **Flexible for many applications:** Engravings and inscriptions, coins and medals, extrusion dies, technical miniature moulds, injection moulds for the toy industry
- **Laser machining of standard materials** as well as advanced materials, including glass, ceramics and carbide
- **Feasibility of steep walls** of the highest quality, with the highest process reliability (depending on the material)
- **Easy and fast importing of CAD data**

LASERSOFT 3D-Software features

**3D Draft Angle with Defined Wall Angles**

Starting with 2D CAD data in DXF format, the programme will take into account the desired depth and draft angle to automatically generate the programme for the laser machine. This means easy creation of engravings, logos, symbols, simple tools, etc.

**3D Bitmap Generator**

Based on greyscale images in bitmap format, different grey levels can be assigned to different depths. This allows 3D reliefs, surface structures, logos, etc. to be produced, even when using a basic scanned document. It is also possible to reduce data volume by converting STL data into bitmap data.
3D Cylinder Machining
This feature allows you to edit cylinder and cone geometries, which can be combined as required with a rotary axis.

3D Free Surface Projection
Vertical projection of the geometry to be machined on slightly inclined free-form surfaces. The machining geometry is extended depending on the angle of inclination of the projection surface.

Laser Marking
Inscriptions directly from the LASERSOFT 3D control software. You can select the text, font, gradient and other text attributes.

Job Creator
This software feature allows the placement of several different work pieces on the machine table (using the carrier system / pallet) as well as manual setup of the work pieces with the aid of a camera.

Auto Video Setup
Automatic calibration of clamped components incl. calculated correction (displacement or rotation) of the corresponding component programmes. The built-in CCD camera finds predefined measurement points to make automatic position corrections.
Laser Texturing

Design advantage for injection mould making. The most important target markets.

The time of simple leather structure interiors for cars is as outdated as the mass-produced textures for many consumer goods. The innovative 5-axis laser texturing makes it possible to quickly produce individual surface textures in plastic injection moulds. The design possibilities for challenging visual surfaces are now unlimited.

Highlights

+ Realisation of individual, challenging 3D textures with free-form surfaces made from injection moulds
+ The high machine precision makes excellent contour sharpness and consistency possible via laser machining
+ Contour parallel laser shaping: Laser focus follows the 3D contour of the work piece
+ Laser lacquer removal with a track width of 40 μm possible
+ Highly dynamic, temperature monitored precision scanner
+ Fibre laser with up to 200 Watts; Additional options: various focus lengths

Automotive

(1) Steering Wheel Cap: Honeycomb structure
(2) Motor Cover: Pyramid structure
(3) Tire Side Wall: Carbon fibre structure
(4) Glove Compartment Door: Combination of honeycomb / leather structure
(5) Connecting Rods: Cell structure

The Comprehensive, Digital Process Chain

- Milling the mould
- Honeycomb and leather structure with transition
- IGES of the 3D tool mould
- Uniform transfer of the texture to the mould
- 3D simulation of the CNC machining programme
- 5-axis laser texturing of the surface structure
- Finished structured injection mould
- Finished plastic injection moulded part

Laser Texturing

The comprehensive, digital process chain – from the idea to the final, structured injection-mould piece.

The all-encompassing LASERSOFT 3D-TEXTURE guides the user from the setup of the greyscale bitmap through to the finished, textured component. The projection of the texture on free-form surfaces is implemented via standardised software tools. The 5-axis laser-machining programme is generated completely automatically. Transitionless “patching” of even large visible surfaces and the contour-parallel lasering on complex 3D free-form surfaces opens unlimited possibilities for the design and implementation of individual repeatable surface structures.
The all-encompassing LASERSOFT 3D-TEXTURE guides the user from the setup of the greyscale bitmap through to the finished, textured component. Transitionless “patching” of even large visible surfaces and the contour-parallel lasering on complex 3D free-form surfaces opens unlimited possibilities for the design and implementation of individual repeatable surface structures.

“Variable patch field sizes” with no visible separation lines
Crucial for the quality of the mapped surface structure is the lowest possible distortion of the image on the three-dimensional contour. The individual tiles (structure fields) must be placed together so that no dividing lines and impacts are visible. The intelligent “Variable Patch Field Sizes” software aids this process.

“Contour-parallel laser shaping” for quick process execution on complex forms
Depending on the 3D contour of the work piece, the laser focus can be dynamically shifted to the Z-axis via a Z-shift. You no longer have to reposition the laser head or the work piece on the Z-axis for every new lasering trace, saving you significant time.

Central supply with texturing information for identical results around the world
The comprehensive, digital process chain makes it possible to generate centrally unified texturing data, which in turn can be distributed to subsidiaries, licensees and structured partners worldwide. This allows the same component to be manufactured with the same texture worldwide.

Easy operation with Bitmaps / 3 easy routes to a personalised texture
1. Create the texture with a CAD programme
2. Create the texture with a graphics programme e.g. Photoshop, Gimp etc.
3. Scan a real 3D object e.g. via GOM 3D scanner

As the successor to the LASERTEC 40, the new LASERTEC 45 boasts the highest diversity, a completely new operating concept, a larger work table, longer traverses, higher workpiece weights and fully integrated 5-axis machine kinematics.

The new user-friendly control interface allows for simple operation by touch screen, direct programming into the control system and offline programming for more complex components.

Whilst providing maximum process reliability and reproducibility, the new LASERTEC 45 can generate geometrically defined surface structures, the finest contours and delicate cavities for the production of injection moulds, extrusion dies, inscriptions and engravings of the highest quality in 2D and 3D forms and with no tool wear.

### Highlights

+ Highly compact 5-axis machine concept with a large working area measuring 700 × 380 mm
+ Higher deposition rates thanks to the re-adjusted precision scanner system
+ 5-axis laser machining made possible by the integrated swivel/rotary axis with torque motors (optional)
+ 80 % larger working area with the same space requirements plus 3 times higher dynamics with 60 m/min rapid traverse (compared to the LASERTEC 40)
+ The new, user-friendly user interface allows for intuitive programming via the touch screen
+ Operate 4.5 on SIEMENS 840D solutionline with 15” touch screen

1: Working area image with integrated NC swivel rotary table (optional), precision scanner optics, measuring sensor for depth regulation, CCD camera for X/Y orientation with ring light
2: Maximum precision with the inherently stiff and low-vibration column
3: 5-axis version – Fully integrated NC swivel rotary table (A axis -100° to +120° / 100 kg)
4: Also available in a 3-axis version with rigid table (840 x 420 mm / 400 kg)
Thanks to its highly compact, stable design, in combination with the high-performance picosecond laser the LASERTEC 50 is particularly suited to demanding 5-axis machining work involving the production of complex prototypes and special cemented carbide workpieces. This means even surface finishes of $Ra < 0.3 \, \mu m$ can be achieved in cemented carbide tools. The LASERTEC 50 with picosecond laser is available with a 25 W or 50 W laser.

**Highlights**

- Linear drives with acceleration $> 1 \, g$
- Highly dynamic torque motors in both rotary axes (B- and C-axis)
- High positioning accuracy of $\leq 8 \, \mu m$
- CCD camera and 3D measuring probe for fast setup
- Massive, vibration dampening machine bed with 3-point support
- User-friendly Siemens 840D solutionline CNC control (comes standard)

The highly dynamic LASERTEC 65 combines, for the first time, all the stability advantages of monoBLOCK® design with the benefits of a quick swivel rotary table and is the most compact machine in its class, with a 7.5 m² footprint. Equipped with an optimally accessible, large work area and travels of 650 × 650 × 560 mm (X / Y / Z), it dominates as a highly flexible 5-axis machine for all laser and milling applications with an uncompromisingly high level of quality. For the first time, the LASERTEC 65 Shape offers 5-axis milling and laser structuring of 3D plastic injection mould tools on one machine in a single setup. After the milling of the mould, a geometrically defined surface structure is applied via fibre lasering. Final erosion or etching is not necessary.

**LASERTEC 65 Shape**
ALL-IN-1 – 5-axis laser machining and milling in one precision machine.

**Highlights**
+ MILL + LASER: Fully-fledged 5-axis milling machine from DECKEL MAHO in the stable monoBLOCK® design; flexible integration of a laser head via an HSK interface
+ Conversion from milling to laser operation in < 10 min.
+ Large work area for work pieces up to ø 840 mm, 500 mm high and max. 1,000 kg
+ Crane loading from above over the table centre (comes standard)
+ Accessibility and ergonomics: Door opening is 1,430 mm, optional accessibility from the front
+ Small 7.5 m² footprint

**Laser power:** Fibre laser with max. 200 Watt output with various focal lengths.

* Based on the milling machine configuration for absolute long-term stability and repeat accuracy

1: Large working area with integrated NC swivel rotary table with perfect accessibility, can be loaded from above by crane
2: Highly stable, compact monoBLOCK® design
3: Flexible integration of a laser scanning head via an HSK interface on the spindle, 5-axis laser texturing of a steering wheel injection mould
LASERTEC 210 Shape

Unique technology combination: 5-axis milling and laser structuring in XXL.

LASERTEC 210 Shape provides a universal solution for 5-axis milling / laser complete machining of injection moulds up to 2.1 m work piece sizes. Also, the laser head can be flexibly integrated into the milling spindle via the HSK-A100 interface within 10 minutes. During the actual milling operation, all optical components of the laser are located outside the work area.

The portal series is successful and proven with more than 900 machines installed worldwide. It is based on a FEM-optimised machine concept with a portal design. The thermo-symmetrical structure, with liquid-cooled ball screws and cooled feed motors on all axes, provides the highest level of dynamics and long-term precision. The portal design of the LASERTEC 210 enables simple and effective machining of workpieces up to 10 t.

**Highlights**

+ Thermo-symmetrical structure and 3-point support for quick setup
+ Short and constant projection of the milling head (no ram design) gantry design
+ Vertically traversable crossbeams featuring hydraulic weight compensation for the highest precision and dynamics
+ Infeed and rapid traverse up to 60 m/min
+ Machining of work pieces up to 8 t (optional: 10 t)

Perfect cutting edges, relief angles and chip breakers in precision tools
LASERTEC PrecisionTool

With the laser into a new dimension of PCD cutting edge machining.

Where conventional machining processes, such as grinding and eroding with high process forces as well as negative thermal reactions in diamond cutting materials, have already been pushed to their limits – innovative laser technology can unlock new machining possibilities. As a pioneer in this field, SAUER has many years of experience in laser machining of PCD, CVD-D, CBN and carbide.

The LASERTEC PrecisionTool Series covers the splitting of PCD blanks, introduction of chip breakers and finishing of cutting edges and relief angles. As a new laser source with high energy efficiency that uses no consumable materials, the manufacutring of these diamond tools is truly a “Green Technology”.

- **Laser Produces “Super Sharp”**
  Cutting without chipping

- **ALL-IN-1**
  Create cutting edges, relief angles and chip breakers in PCD / CVD-D in a single setup on one machine

- **Introduction of Chip Breakers**
  also in CVD-D and CBN for controlled chip breakage and longer tool life

- **Separation and Cutting**
  Of PCD blanks 10 x faster than wire cutting

- **Prototype production**
  of cemented carbide inserts and 5-axis laser machining of prototype inserts with clearance angle

- **Extrusion die production**
  of a cemented carbide extrusion die with Ra = 0,3 µm with a picosecond laser
Break-out-free cutting edges, relief angles and chip breakers in PCD / CVD-D, CBN.

Laser Machining of PCD / CVD-D, CBN Highlights

+ Break-out-free cutting edges because the laser cuts through the diamond and binding material
+ Coarse-grained PCD grades can be processed without loss of quality
+ Chip breaker grooves can be incorporated in one setup with the cutting edge machining
+ Through the fine laser focus, inner radii of min 15 μm can be created
+ Lower operating costs because there are no costs for wire or grinding wheels
+ Contact-free precision machining without tool wear
+ Automation solutions for handling cutting inserts, end mill cutters, monoblock tools with HSK holder (different types of tools can be combined in one automation process)

Laser vs. Grinding and Eroding.

Prototype manufacturing of carbide indexable cutting inserts and laser machining of carbide pressing tools.

**Carbide Machining Highlights**

+ Simple and affordable solution for producing complete chip pressing tools geometries for prototypes
+ NEW picosecond laser: The high-end solution for the finishing of carbide extrusion dies with surface quality up to Ra 0.3 μm
+ LASERTEC 50 with picosecond laser: The 5-axis solution for complex prototypes and special machining with carbide
The LASERTEC 20 combines dynamic performance, precision, compactness, versatility and intelligence in a high-tech machine. Linear drives in X / Y / Z with > 2 g, a 5-axis portal design with integrated NC swivel rotary table on a 3.5 m² footprint, high contour accuracy and the numerous application-specific LASERSOFT software features are only the most impressive highlights of this precision machine. The universal 5-axis kinematics with integrated A- and C-axis, long-term stable monoBLOCK® design as well as excellent positioning- and repeatability accuracy make the LASERTEC 20 ideal for high-tech manufacturing of precision tools and 3D fine cutting of precision parts for the watch and medical industries.
Universal handling system with application-specific configuration levels.

The integrated PH 10 | 100 automation solution allows substitution of 42 HSK tools or several hundred cutting inserts (option: extendible pallet) into the work area from above. A workpiece change takes ≤ 30 seconds. The compact, integrated design ensures optimal access to the work area and automation.

Long-term Stability
Stable, vibration-dampening cast mineral stand (approx. 3t) in the mono-BLOCK® design with a compact 3.5 m² footprint.

Linear Technology
Linear drives with > 2 g max. acceleration as well as precision cooling in X / Y / Z (comes standard) / 6-month warranty.

3D Work Piece Measuring
High-precision tool measurement and workpiece positioning in the working area with the infrared measuring sensor.

Zero Point Clamping System
Consistently precise workpiece handling e.g. via the HSK interface.

1: Working area: 100 W fibre laser, laser head with new precision scanner and integrated infrared measuring sensor, HSK-63 interface integrated into the machine table (optional)
2: Laser machining a PCD thread milling cutter
LASERSOFT PrecisionTool Software Package

User-friendly software features for the manufacturing of all PCD tools.

**LASERSOFT insert**
- Easy programming of standard cutting inserts by entering ISO codes or alternatively: menu-guided programming
- Definition of measuring points for the automatic measurement of the inner circle and the position of the PCD insert

**LASERSOFT endmill**
- Programming of simple end mills to complex progressive dies
- DXF interface for the input of the outer contour
- Free definition of relief angle form and clearance angle for each contour element
- Automatic measurement of the axial and radial position of the cutting inserts with automatic programme adjustment
The LASERSOFT 3D programming system, along with the powerful Siemens 840D contour control, makes CNC programming directly from 3D CAD data possible. The special software interface allows parameterised input of standard inserts for a highly efficient and productive laser machining.

**LASERSOFT turning**
- For die plates with almost any contours
- Programming of fixed mould tools via the DXF interface

**LASERSOFT chipbreaker**
- For die plates with almost any contours
- Programming of fixed mould tools via the DXF interface
Highly Dynamic 5-axis Laser Fine Cutting

Production of challenging 2D / 3D precision cutting parts for watches, stamping parts and the medical industry.
LASERTEC FineCutting

Precision laser cutting of sheets, pipes and 3D parts with up to 20 μm cutting gap.

The modular machine design with three to five CNC controlled axes allows the most flexible use of the LASERTEC 20 FineCutting for highly dynamic precision cutting of fine cutting parts in 2D and 3D. The laser source can always be adjusted according to type and performance for the relevant component in regards to quality, speed, and material. You can choose between fibre and Nd:YAG laser sources with different laser output performance.

Application examples for precision cut parts can be found in the watch / stamping / electronics and medical industry for production values with max. 4 mm thickness and min. laser cutting gap of 20 μm. Already today, stencils, apparatus parts, watch components, medical implants, arthroscopic instruments and spinnerets for textile fibres are made on the LASERTEC 20 FineCutting.

Highlights

+ Application independent integration of different laser sources (fibre laser, QCW fibre laser, Nd:YAG)
+ Laser machining of watch / stencil / medical / fine-cut parts with a fibre laser
+ Up to 3 μm component precision (3-axis)
+ Min. laser cutting gap of 20 μm
+ Automation via robot loading possible
STATE-OF-THE-ART

Technology leader in 5-axis precision drilling of cooling air holes for aerospace and IGT.
LASERTEC PowerDrill / PowerShape

Cooling air holes in turbine components for aerospace and PowerGeneration.

The PowerDrill Series is specifically designed for 5-axis laser precision drilling of turbine blades and components for the aerospace industry and stationary gas turbines. Precision cooling air holes with partially conical and cylindrical shape are laser drilled in turbine vanes / blades, burners and combustion chambers as well as other components for high-pressure gas turbines using percussion drilling, trepanning or 5-axis simultaneous cutting.

The automatic measuring sensor positions the component exactly in the right position, negating the need for arduous clamping devices. After inserting the cylindrical cooling air holes, they can be expanded on the LASERTEC 50 / 80 via laser ablation by a conical outlet funnel. The PowerDrill software tools enable comfortable programming and machining of complex components.

The LASERTEC 50 is a highly dynamic laser precision machine capable of handling challenging 5-axis machining with its built-in X- and Y-axis linear drives featuring > 1 g acceleration as well as water-cooled torque drives in the 4th and 5th axis. This high flexibility along with numerous application-specific machine options and laser sources enable universal use of this machine size in almost all LASERTEC-technology fields.

With a footprint of only 4 m² and relatively large work area featuring travels of 500 mm x 500 mm x 700 mm in X / Y / Z, this machine not only stands out with its high dynamics, precision, flexibility and long-term stability, but also with its optimal accessibility and compactness.

### LASERTEC 50 PowerDrill

**Highlights**

+ Linear drives with acceleration > 1 g
+ Highly dynamic torque motors in both rotary axes (B- and C-axis)
+ High positioning accuracy of ≤ 8 μm
+ CCD camera and 3D measuring probe for fast setup
+ Massive, vibration dampening machine bed with 3-point support
+ User-friendly Siemens 840D solutionline CNC control (comes standard)

1: Clearly structured working area with optimal workpiece accessibility  
2: Laser nozzle with quick-change interface  
3: Laser precision drilling of cooling air holes  
4: Integrated NC swivel rotary table with torque drives  
5: The linear motors and the laser are outside of the work area
High positioning accuracy and dynamics of the X- / Y-axis, the Z-axis as a ball screw drive and rotary axes in the torque technology are just some of the LASERTEC 80 highlights. The X- / Y-cross table with direct drives and a massive machine bed with three-point support provide high-precision 5-axis laser machining. Integration of varying laser resonators and easy maintenance with optimal accessibility to the laser via a walk-in stand further enhances this offering.

The LASERTEC 130 sets the standard for drilling large turbine components. Two highly dynamic torque motors in the component axis of rotation and the laser head ensure the highest precision and fast processing. With the integrated focusing head changer, the LASERTEC 130 has a wide range of applications, including aerospace / power generation as well as 5-axis laser drilling for sizes up to 1,300 mm.

LASERTEC 80 / 130 PowerDrill

Strong performance for the laser machining of turbine components up to XXL.

### Applications and Parts
- **Machine and Technology**
  - LASERTEC 80 / 130
- **Control Technology**
- **Technical Data**
- **LASERTEC 80 / 130 PowerDrill**
  - Strong performance for the laser machining of turbine components up to XXL.
- **LASERTEC 80 Highlights**
  - + 5-axis laser precision milling of cooling air holes in turbine components
  - + Linear drives in X / Y with 1.2 g
  - + 4th / 5th axis with torque technology
  - + Automatic breakthrough detection guarantees faster machining
  - + Highly precise Nd:YAG laser with 300 W / 500 W
  - + CCD camera and 3D measuring probe for fast setup
  - + Siemens 840D solutionline with special LASERSOFT PowerDrill software features
- **LASERTEC 130 Highlights**
  - + Highly dynamic 5-axis laser drilling of cooling air holes in combustors, vanes and blades (up to max. 1,300 mm)
  - + Automatic focusing head changer
  - + Swivel head (B-axis: ± 150°) and rotary table (360°, continuous) with torque motors
  - + Double collision protection in the laser head and laser nozzle
  - + Constant optical path for consistent drilling quality
  - + High-speed shutter enables SynchroDrill (synchronised laser drilling with a rotating component)
  - + Siemens 840D powerline with special LASERSOFT combustor software features

### Available as
- Work Area
  - **LASERTEC 80**
    - PowerDrill / PowerShape
    - X-axis: 800 mm
    - Y-axis: 500 mm
    - Z-axis (focusing axis): 700 mm
    - Table size (3 axes): 900 x 600 mm
    - Max. table load (3 axes): 200 kg
    - B-axis (swivel range): –100 to +150 Degrees
    - C-axis (speed): 360° continuous
    - Table size (5 axes): ø 200 / 400 mm
    - Max. table load (5 axes): 14 / 40 kg
    - Rapid traverse in X / Y / Z: 120 / 120 / 30 m/min
    - Acceleration: 1.2 (X / Y) g / 0.5 (X) g
    - Connection power (incl. aggregate): max. 72 kVA
    - Operating voltage: 400 / 50 V / Hz
    - Machine / Unit weight: 7,000 kg
    - Footprint W / D / H: 4,500 / 6,000 / 2,300 mm
    - Control: Siemens 840D solutionline
  - **LASERTEC 130**
    - PowerDrill
    - X-axis: 1,300 mm
    - Y-axis: 920 mm
    - Z-axis (focusing axis): 820 mm
    - Table size (3 axes): 900 x 600 mm
    - Max. table load (3 axes): 200 kg
    - B-axis (swivel range): ±150 Degrees
    - C-axis (speed): 360° continuous
    - Table size (5 axes): ø 450 mm
    - Max. table load (5 axes): 100 / 500 (static) kg
    - Rapid traverse in X / Y / Z: 30 / 30 / 30 m/min
    - Acceleration: 0.5 (X) g
    - Connection power (incl. aggregate): max. 92 kVA
    - Operating voltage: 400 / 50 V / Hz
    - Machine / Unit weight: 18,000 kg
    - Footprint W / D / H: 7,450 / 6,100 / 3,378 mm
    - Control: Siemens 840D powerline
PowerDrill Machine Options / Software Features

Technology-specific machine features and optimal performance with LASERSOFT PowerDrill.

The powerful and user-friendly Siemens 840D CNC control provides maximum operator comfort and process reliability for the laser drilling of turbine components. All available LASERSOFT PowerDrill packages combine high-tech performance with customer value, delivering easy application-oriented programming and operation.

Machine Options

**Integrated Measuring Probe**

Integrated 3D measuring probe for automatic detection of the work piece position in the work area as well as the application of a “best fit” – algorithm, which automatically arranges the incoming cooling air holes in relation to the CAD model.

+ Customised number of measuring points possible
+ Descriptive, graphical illustration
+ Allows the use of simple work piece holders
+ Consistently precise laser machining of high-quality components

**Break-through-detection**

Fully integrated optical sensor for automatic break-through detection during laser drilling of turbine components.

+ In-process regulation
+ Significantly reduced “back wall damage” and faster drilling
+ 20% faster machining through optimal number of impulses
+ Selectable number of cleaning impulses depending on material and application
Software Features

**LASER SOFT PowerDrill**
+ 3D laser drilling programming system and special "repair & redrilling" software
+ Automatic probing and positioning of the work piece
+ Cycles for percussioning and trepanning
+ 5-axis simultaneous machining of shaped drillings

**LASER SOFT Simulation**
+ Graphical 3D simulation incl. drilling positioning, tool track, collision control, and definition of drilling sequences
+ Editing of the CNC programmes during simulation possible

**LASER SOFT PowerShape**
+ Production of shaped hole geometries via laser ablation
+ Transfer of work piece positioning data from the PowerDrill machine
+ Automatic programming of complete turbine blade from 3D CAD data

**LASER SOFT Weld**
+ Special software for laser welding of cover sheets
+ Teach-in mode for defining welding points
+ Automatic contour recognition via CCD image data processing

**LASER SOFT Combustor**
+ SynchroDrilling: Laser drilling during component rotation, single & multipulse operation possible and user-friendly parameterised programming system with 3D simulation
+ PatternDrilling: Laser drilling of segments and single rows possible

**LASER SOFT PartProbing / PartMapping**
+ Measuring of rotation symmetrical components via a capacity sensor
+ Automatic compensation via axial and radial displacement

Progress Through Innovation

Turnkey provider with impressive technology expertise.

In addition to the actual machine production, SAUER LASERTEC also offers you the required user expertise in all five technology areas and supports customers with feasibility studies, process optimisation as well as turnkey developments. SAUER GmbH also regularly hosts LASERTEC Technology Seminars for customers and interested parties on the latest machines in a modern LASERTEC Showroom in Pfronten.

LASERTEC Excellence

+ > 25 years of experience in laser precision machining
+ > 500 LASERTEC machines installed (worldwide)
+ Application and technology expertise: Training, customer support, complete turnkey solutions
+ Regular LASERTEC Technology Seminars

SAUER ULTRASONIC in Stipshausen supports the economical machining of advanced materials (e.g. glass, ceramic, corundum, fibre composite materials) with reduced process forces to enable surface quality of Ra < 0.2 µm.
Customer First – Our service promise!

“We have good news for you: Our service and spare parts prices have been completely revised. With our service commitments, we want to meet your high demands with the highest service quality.” Please contact us – your sales and service team is at your disposal!

Top quality at fair prices. It’s a promise!

Best Price Guarantee for Original Spare Parts. Should you get a spare part offered by us at least 20 % cheaper elsewhere, we will refund the price difference up to 100 % *

Spindle service at best prices. The highest level of competence from the manufacturer at new and attractive prices – DMG MORI spindle service!

Up to 50 % lower service costs. New Flat Call-Out Rate – without travel expenses or any additional costs!

Our protective shield for your productivity. Reduced operating costs, highest machine availability and maximum precision – DMG MORI ServicePlus!

*All information and price advantages for Customer First are available at: customer-first.dmgmori.com
